```

This sequence encodes a novel human gene, bcl-w, from the bcl-2 gene family, extracted from an adult brain library. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human

Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators

```
The present sequence is described as a derivative of the human bcl-w gene (see AAX25132) and encodes Bcl-w protein (see AAY05532), a pro-survival comember of the Bcl-2 family which is widely expressed and which is comessed and experimental for spermatogenesis. The invention relates generally to a complex that is and to an animal model for the identification of complex and genetic sequences useful for inducing or reducing fertility of molecules and genetic sequences useful for inducing or reducing fertility, confined the sequences of the sequences of infertility, confirmed the sequences of the sequences of the human or murine bcl-w gene or in a gene associated with bcl-w. Such animals have disorganised companies tubules and are substantially infertile, but possess no other companies of inducing, enhancing or otherwise facilitating spermatogenesis capable of inducing, enhancing or otherwise facilitating spermatogenesis.
                                                                                                                                                                                                                                                                                                           An animal protein as

At least part of one strand (asl) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            09-JAN-2001; 2001DE-01000586.

AC AREASTOP
AC AREASTOP The invention relates to inhibiting expression of a target gene in a by introducing at least two oligoribonuclectides (dsnNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleous pairs. At least part of one strand (S1, S2) of the ds structures in each dsnNAI and II are complementary to regions in the target gene. The nucleotide each

The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                 This invention describes a novel method for inhibiting expression of a CC target gene by introducing into the cell that contains the target gene at CC least one oligoribonucleotide (dsnNAI) that has a double-stranded (ds) Structure of not more than 49 consecutive nucleotides (nt), where at CC least a segment of one strand of the ds structure is complementary with CC the target gene and the cells are treated with interferon before introduction of dsnNAI. The method is used to inhibit expression of CC target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, developmental or prion genes, or inhibit expressed in CC pathogenic organisms (particularly plasmodia) or in viruses or viroids CC (pathogenic in humans, animals or plants). Treating the cells with CC interferon greatly increases the extent to which dsnNA can inhibit CC expression of the target genes, and the effect is even greater when dsnNA CC gene fragments used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting expression of target genes, e.g. oncogenes, in cells, b introduction of complementary double-stranded oligoribonucleotide, treating the cell with interferon.
                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Page 35-36; 98pp; German.

                                                                                                                                                                                                 The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonuclectide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytchine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; HIV; HCV; gene expression; oligoribonucleotide; tumour; pathoge plasmodium; virus; viroid; cytokine; prion; antisense oligonucleotide; cytostatic; virucide; protozoacide; antibacterial; ds.

Novel DNAzyme useful for treating tumors, and for enhancing the sensitivity of malignant or virus infected cells to therapy, concatalytic domain and binding domain contiguous to the catalytic domain.

Disclosure; Page 44-45; 67pp; English

The invention relates to a DNAzyme which specifically cleaves mRNA transcribed from a member of the bol-2 gene family. The DNAzymes compi a catalytic domain, binding domains contiguous with the 5° and 3° end the catalytic domain, and therefore hybridise with, the two regions immediately flanking the purine residue of the cleavage site within the composition of the cleavage site within the state of the cleavage site within the state of the cleavage site within the composition of the composition of the cleavage site within the composition of the compositio comprise end of the

The DNAzymes are useful in diagnostics, therapeutics, prophylaxis, research agents and in kits. The DNAzymes are also useful for increasing the susceptibility of tumour cells to anti-tumour therapies such as chemotherapy and radiation therapy. This polynucleotic sequence represents a human bc1-2 gene of the invention

                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the human bol-w gene encoding Bcl-w protein (see CC AAY05530), a pro-survival member of the Bcl-2 family which is widely compressed and which is essential for spermatogenesis. The invention CC relates generally to a method of treatment and to an animal model for the cidentification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the CC treatment of infertility, or for reducing fertility, by modulating CC spermatogenesis. An animal model carries a mutation is at least one CC allele of the human or murine bol-w gene or in a gene associated with bol C. w. Such animals have disorganised seminferous tubules and are CC substantially infertile, but possess no other major abnormalities as CC determined by histological examination. They can be used to screen for CC therapeutic molecules including genetic sequences capable of inducing, CC cenhancing or otherwise facilitating spermatogenesis in animals, or which CC can induce infertility

                                                                                                                                                                                                                                                                                                                                                    family, components in the cell death pathway. The bcl-2 family, components in the cell death pathway. The bcl-2 family have both apoptotic activity and the apoptosis blocking activity, bcl-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding B-cell lymphoma-y protein - useful for producing recombinant protein for use in treating uncontrolled cell growth e.g.
                                                                                                                                                                                                                                                                                                     Sequence 579 BP; 106 A; 154 C; 208 G; 111 T; 0 U;

                                                 The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for
                                                                                                                                                                                                                                                                                                                                                                             Mendrick D,

Nucleic acids encoding B-cell lymphoma-y protein - useful for producing recombinant protein for use in treating uncontrolled cell growth e.g.

The mammalian bol-y genes encode a protein that is a member of the bol-2 family, components in the cell death pathway. The bol-2 family have both apoptotic activity and the apoptosis blocking activity bol-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell

The constitution also describes human bol-y protein (Hbol-y). Rbol-y and CC specification also describes human bol-y protein (Hbol-y). Rbol-y and CP programmed cell death (apoptosis and necrosis). Rbol-y and Hbol-y conditions associated with a disruption of CP proteins may be used to treat conditions associated with a disruption of CP conditions associated with a disruption of CP conditions associated with a disruption of CP conditions with a subject as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, CP conditions where celerosis, myocardial infarction, vitally induced CP cell death, aging, spinal cord injuries and amystrophic lateral sclerosis CP conditions where cells under go premature cell death as a result of CP conditions where cells under go premature cell death as a result of CP conditions which may on the apparent. They may also be used in this CP condition are contrast, if they act as cell death stimulators, Rbol-y and CP period. In contrast, if they act as cell death stimulators, Rbol-y and CP life span such as cancer (especially kaposi's sarcoma and lung cancer) cand auto/hyperimmune diseases. They may also be used to cause cell death conditions associated with prolonged cell can, and hence control, parasites

AAX25133
The present sequence is the mouse bcl-w gene encoding Bcl-w protein (see AAY0531), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene or in a gene associated with bcl which animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Spermatogenesis; animal model; ss.

This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo. e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w modulators, diagnosis, antibody production or screening of potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding inhibit cell survival,
